Setup

Measurements results were corrected by 46 dB to account for the setup.

So, approximately, the additional setup contribution is:

@ 2.0 GHz approx. 0.8 dB
@ 2.5 GHz approx. 1.2 dB
@ 3.5 GHz approx. 1.5 dB

This additional setup contribution was not de-embedded from the results.

*** Note:** Extreme NF values resulted from inadequate EM isolation of the measured device. These values have not been taken into account in the Summary. NF measurements below 10 MHz are not valid, since the noise head used was not calibrated at these frequencies.

**** Note:** Why does the IP3 deteriorates for frequencies below 5 MHz? This issues will be further investigated.
